

Fantastic AGN outflows and where to find them

SUPER survey

Presented by:

Darshan Kakkad

ESO fellow

in collaboration with

The SUPER team

Why SUPER survey?

PI: Vincenzo Mainieri

Madau & Dickinson 2014

Circosta et al. (2018)

- $z = 2.1-2.5$
- AGN outflows across wide range of $L_{\text{bol}} \rightarrow [\text{OIII}]5007$
- Impact on star formation $\rightarrow \text{H}\alpha$
- Impact on molecular gas $\rightarrow \text{CO}(3-2)$

SUPER Sample

Chiara Circosta

Type 2

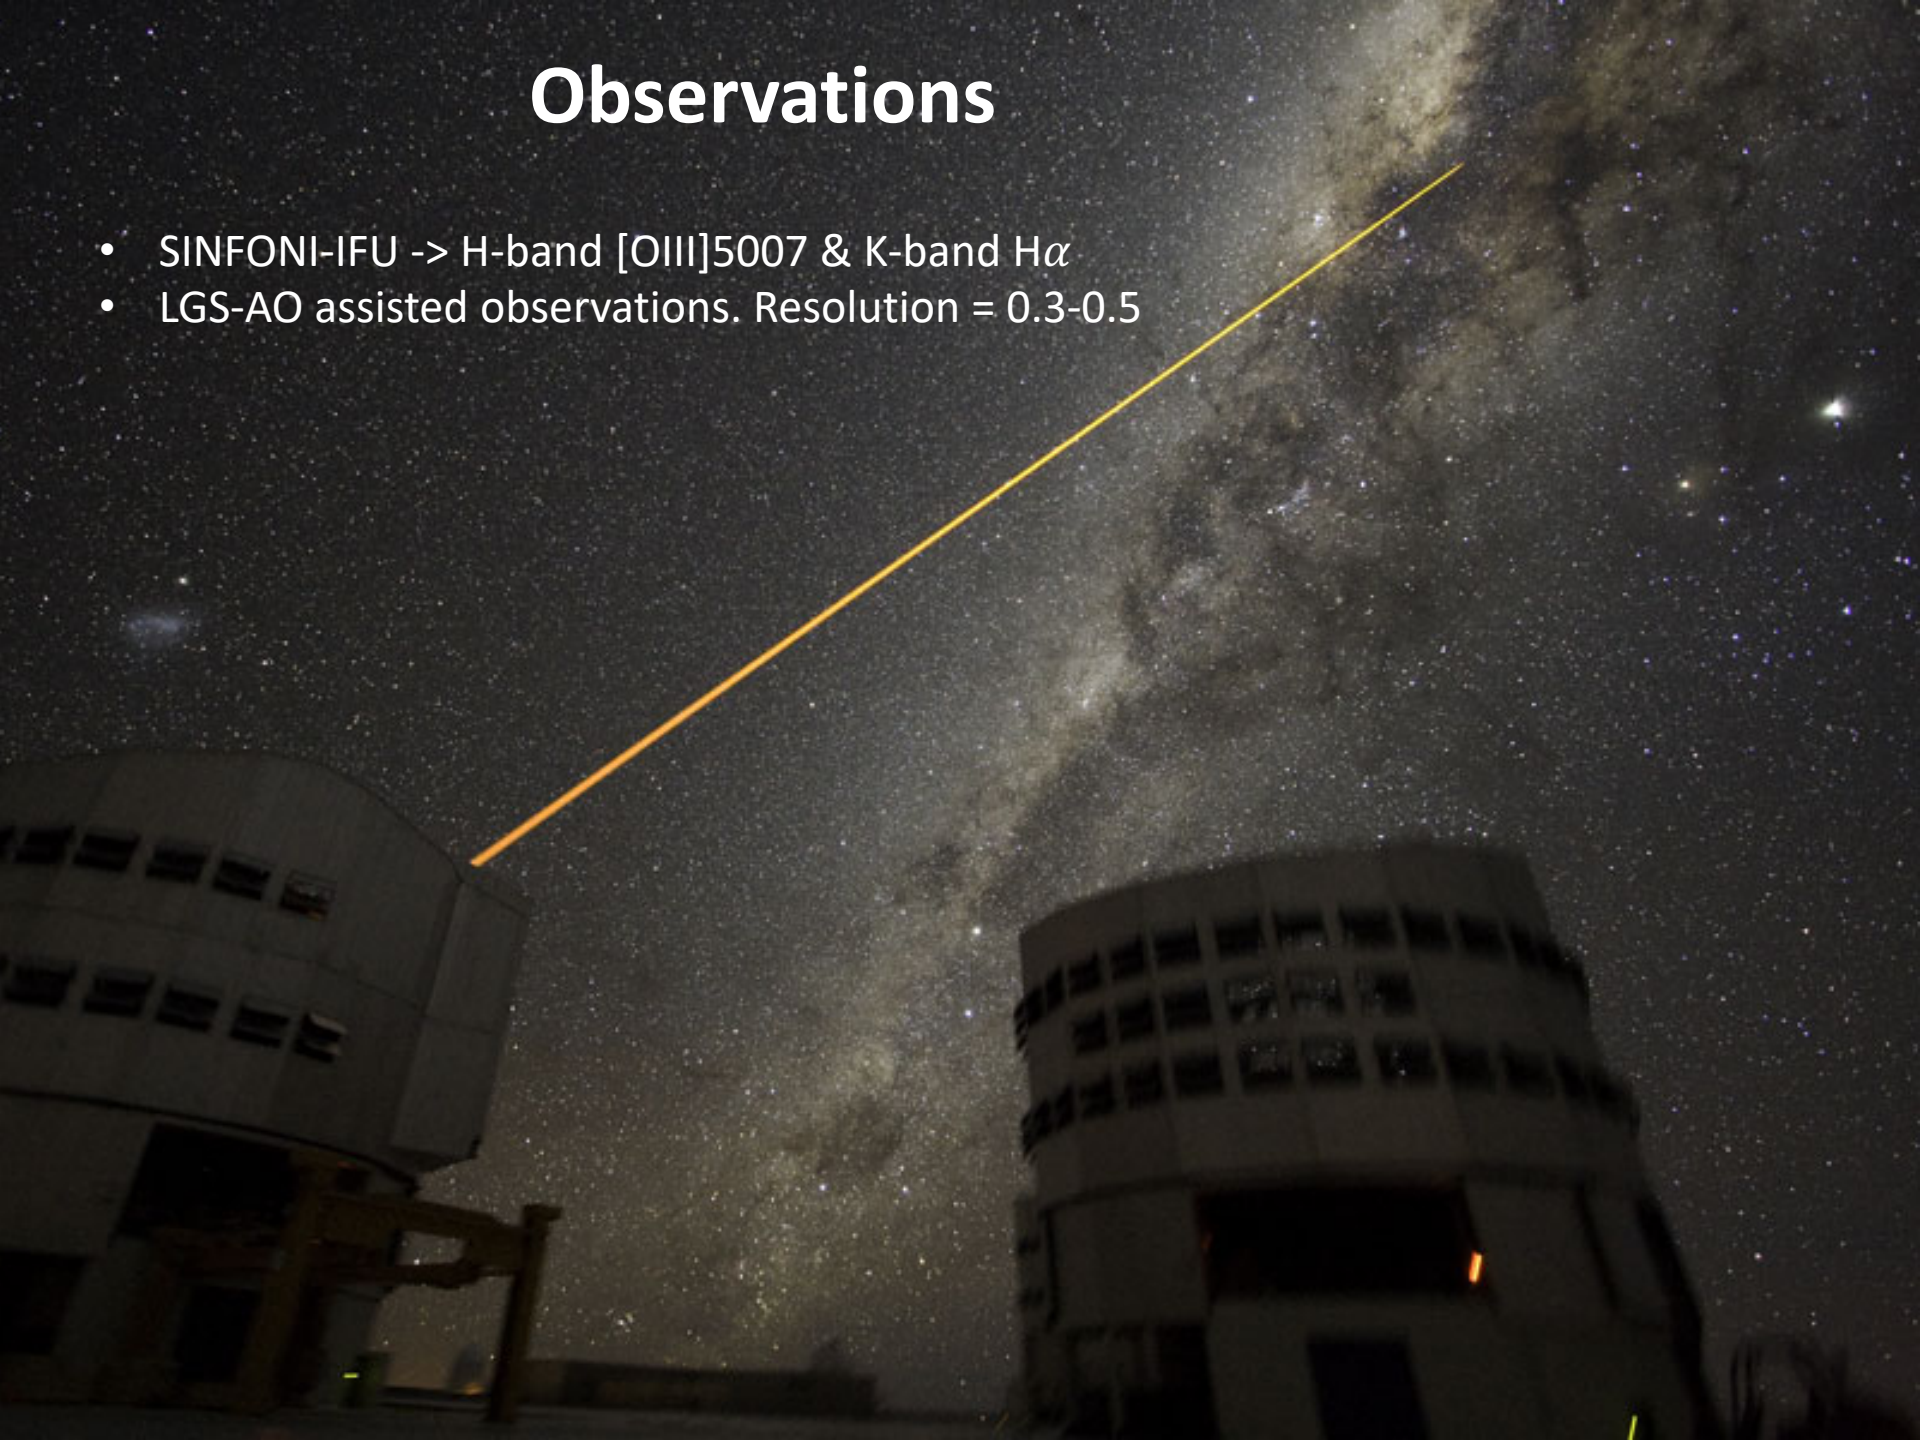

Type 1

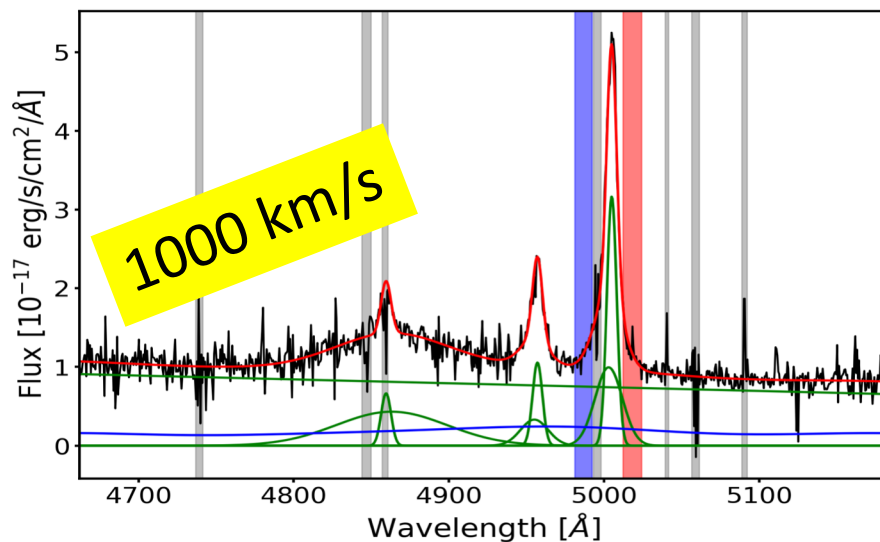

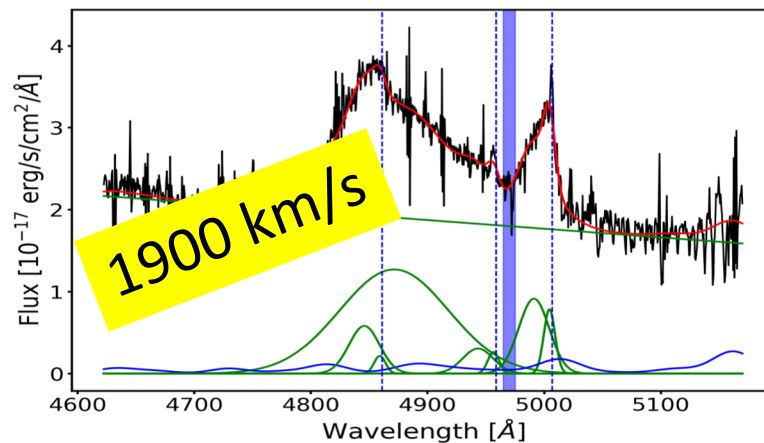

Observations

- SINFONI-IFU -> H-band [OIII]5007 & K-band $H\alpha$
- LGS-AO assisted observations. Resolution = 0.3-0.5

FWHM

SINFONI spectra

Kakkad et al. (in prep)

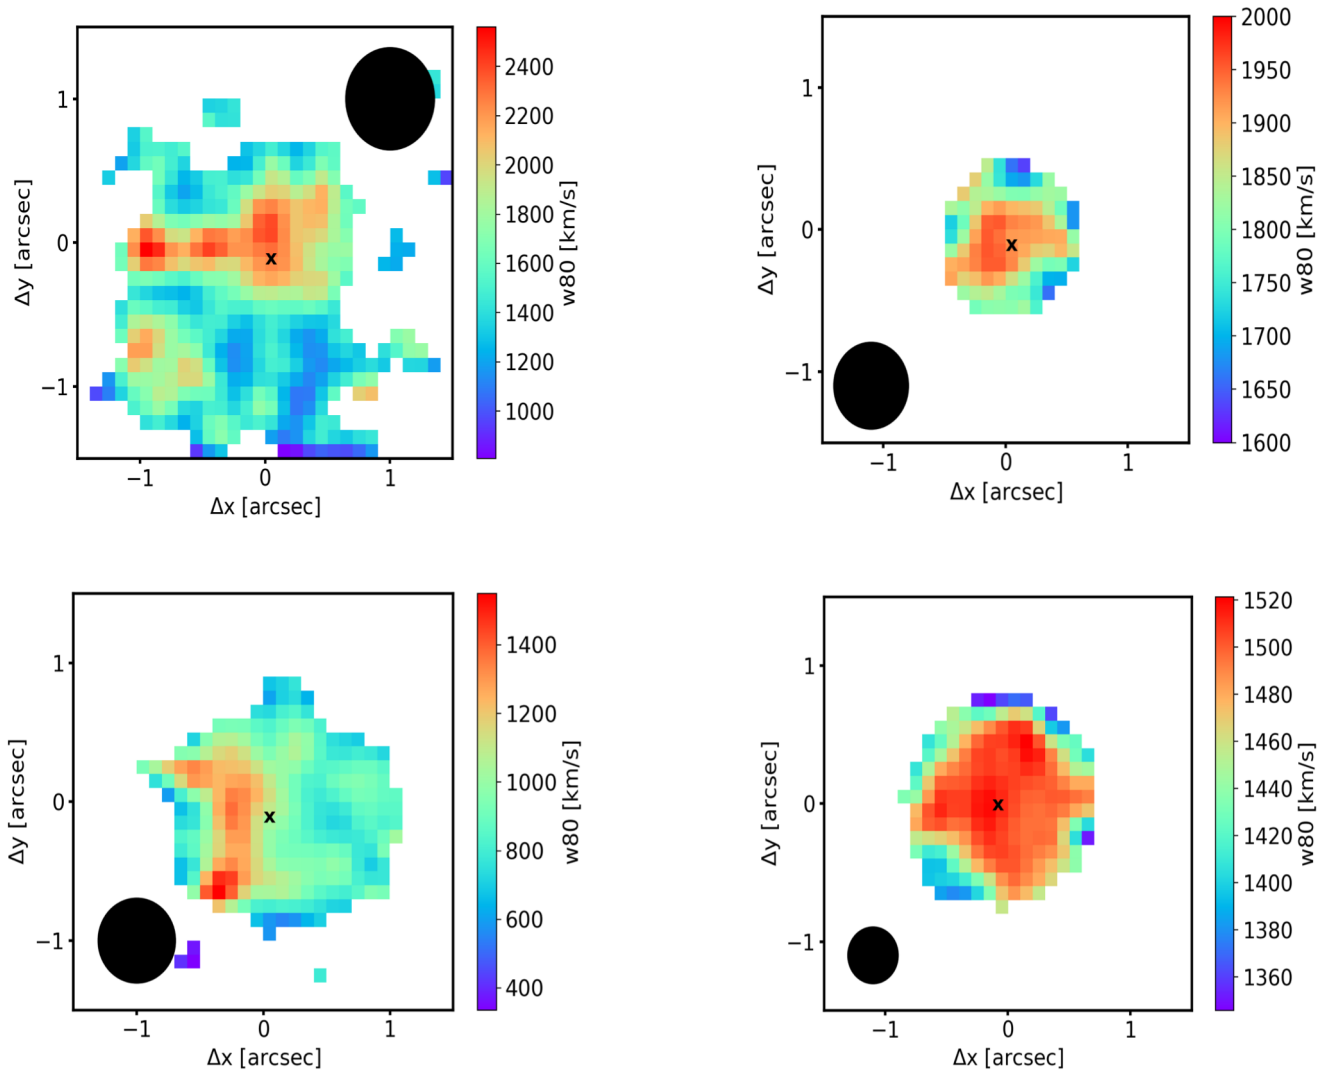

Non-parameteric definition of velocity

KASHz- Harrison et al. (2016)

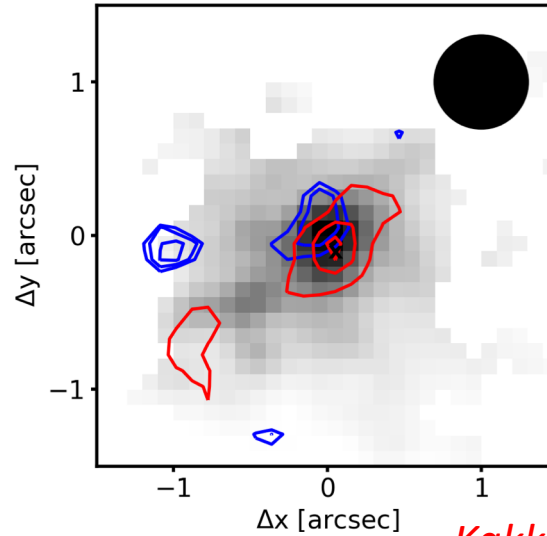

Velocity maps

Kakkad et al. (in prep)

Beam smearing -> B. Husemann talk

Impact on Star Formation?

Kakkad et al. (in prep)

Outflow energy

Adapted from Carniani+ 2015

Ionized outflow traces a fraction of gas -> Probably not for all AGNs

See also Fiore et al. (2017)

Electron densities

Narrow component

$$n_e = <50-300 \text{ cm}^{-3}$$

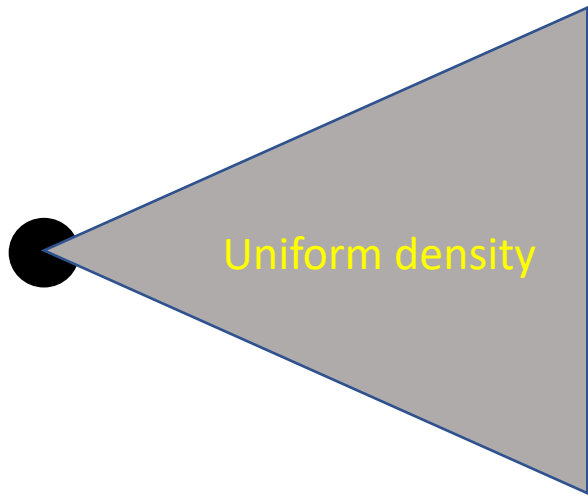

Broad component

$$n_e = <50-2000 \text{ cm}^{-3}$$

Kakkad et al. (2018)

R. Davies talk, Perna et al. (2017) -> Densities in outflowing component $\sim 1000 \text{ cm}^{-3}$

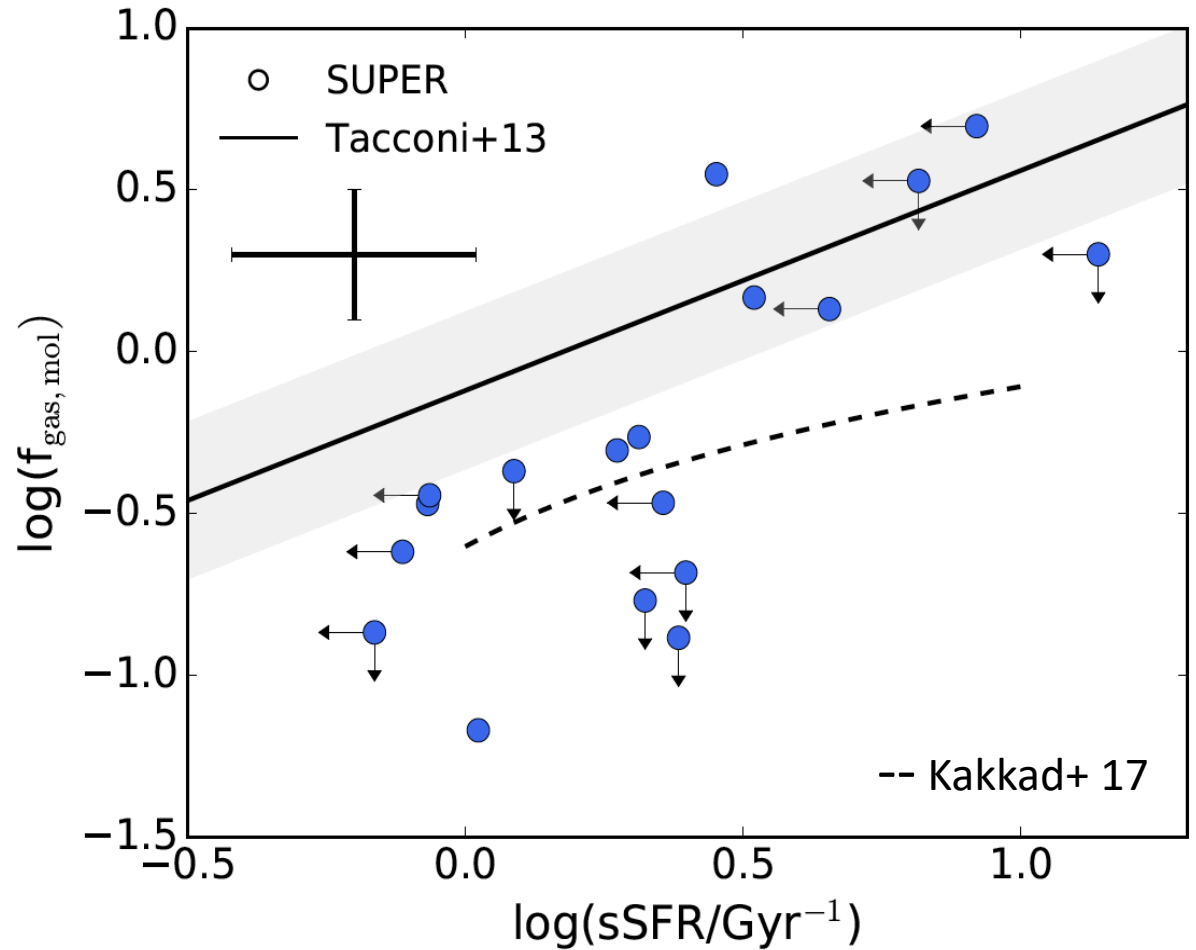

Usually assumed

Richings & FG 2017

CO(3-2) follow-up of SUPER targets -> ALMA Band 3

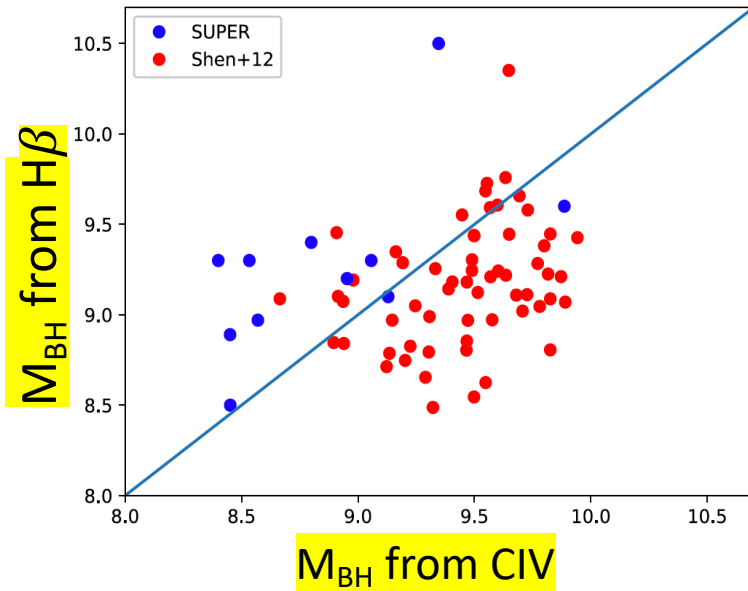

Circosta et al. (in prep)

Black hole mass \rightarrow CIV, $H\alpha$, $H\beta$

Giustina Vietri

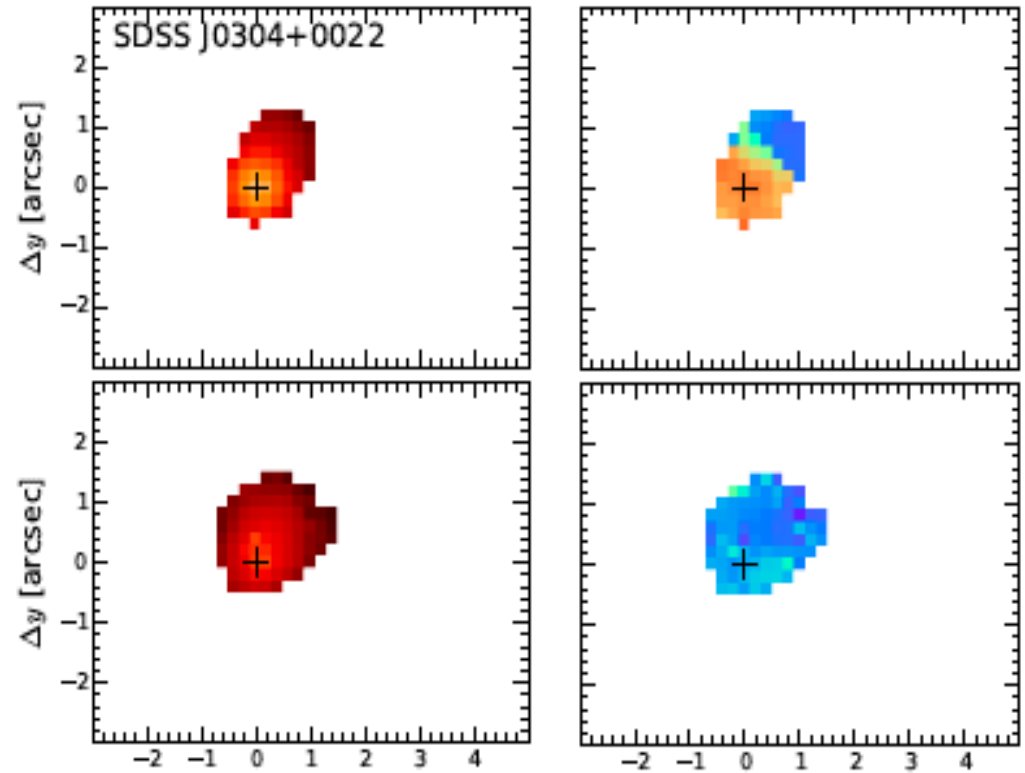

Vietri et al. (in prep)

Beam Smearing

B. Husemann

Husemann et al. (2016)
